like malloc(). If  $n = 10$ , `int arr[n]` will create an array with space for 10 integers.

Accessing elements of an array:

Indexing in arrays starts from 0. So the first element is stored `arr[0]`, the second element at `arr[1]` and so on through `arr[9]`.

You will be given an array of  $N$  integers and you have to print the integers in the reverse order.

#### Input Format

The first line of the input contains  $N$ , where  $N$  is the number of integers. The next line contains  $N$  space-separated integers.

#### Constraints

$1 \leq N \leq 1000$

$1 \leq A[i] \leq 10000$ , where  $A[i]$  is the  $i^{th}$  integer in the array.

#### Output Format

Print the  $N$  integers of the array in the reverse order, space-separated on a single line.

#### Sample Input

```
4
1 4 3 2
```

#### Sample Output

```
2 3 4 1
```

 Hidden Test Case  
Unlock this testcase for 5 hackos.

## Constraints

- $1 \leq t \leq 1000$
- $1 \leq |u| \leq 100$
- The username consists only of uppercase and lowercase letters.

## Output Format

You are not responsible for directly printing anything to stdout. If your code is correct, the locked stub code in your editor will print either **Valid** (if the username is valid), **Invalid** (if the username is invalid), or **Too short: n** (where  $n$  is the length of the too-short username) on a new line for each test case.

## Sample Input

```
3
Peter
Me
Arxwwz
```

## Sample Output

```
Valid
Too short: 2
Invalid
```

## Explanation

Username **Me** is too short because it only contains **2** characters, so your exception prints **Too short: 2**.

All other validation is handled by the locked code in your editor.

You have earned 30.00 points!

    return sum;
}
```

Write a function int max\_of\_four(int a, int b, int c, int d) which returns the maximum of the four arguments it receives.

`+=` : Add and assignment operator. It adds the right operand to `a += b` is equivalent to `a = a + b;`

#### Input Format

Input will contain four integers -  $a, b, c, d$  . one per line.

#### Output Format

Return the greatest of the four integers.

PS: I/O will be automatically handled.

#### Sample Input

```
3
4
6
5
```

#### Sample Output

```
6
```

## Objective

This is a simple challenge to help you practice printing to `stdout`. You may also want to complete [Solve Me First](#) in C++ before attempting this challenge.

We're starting out by printing the most famous computing phrase of all time! In the editor below, use either `printf` or `cout` to print the string **Hello, World!** to `stdout`.

The more popular command form is `cout`. It has the following basic form:

```
cout<<value_to_print<<value_to_print;
```

Any number of values can be printed using one command as shown.

The `printf` command comes from C language. It accepts an optional format specification and a list of variables. Two examples for printing a string are:

```
printf("%s", string); printf(string);
```

Note that neither method adds a newline. It only prints what you tell it to.

## Output Format

Print **Hello, World!** to `stdout`.

## Sample Output

```
Hello, World!
```

Line: 8 Col: 2

You solved this challenge. Would you like to challenge your friends?   

If the `>>` operator returns a value, that is a true value for a conditional. Failure to return a value is false.

Given a string of comma delimited integers, return a vector of integers.

#### Function Description

Complete the `parseInts` function in the editor below.

`parseInts` has the following parameters:

- `string str`: a string of comma separated integers

#### Returns

- `vector<int>`: a vector of the parsed integers.

**Note** You can learn to push elements onto a vector by solving the first problem in the STL chapter.

#### Input Format

There is one line of  $n$  integers separated by commas.

#### Constraints

The length of `str` is less than  $8 \times 10^5$ .

#### Sample Input

```
23,4,56
```

#### Sample Output

```
23
4
56
```

You are given a class - Complex.

```
class Complex
{
public:
    int a,b;
};
```

Operators are overloaded by means of operator functions, which are regular functions with special names. Their name begins with the operator keyword followed by the operator sign that is overloaded. The syntax is:

```
type operator sign (parameters) { /*... body ...*/ }
```

You need to overload operators + and << for the Complex class.

The operator + should add complex numbers according to the rules of complex addition:

$$(a+ib)+(c+id) = (a+c) + i(b+d)$$

Overload the stream insertion operator << to add "*a + ib*" to the stream:

```
cout<<c<<endl;
```

The above statement should print "*a + ib*" followed by a newline where *a* = *c*, *a* and *b* = *c*, *b*.

#### Input Format

```
45  {
46      Complex x,y;
47      string s1,s2;
48      cin>>s1;
49      cin>>s2;
50      x.input(s1);
51      y.input(s2);
52      Complex z=x+y;
53      cout<<z<<endl;
54  }
55
```

Scanned with OKEN Scanner

In the `void Student::input()` function, you must read 5 scores from `stdin` and save them to your `scores` instance variable.

#### Constraints

$$1 \leq n \leq 100$$

$$0 \leq examscore \leq 50$$

#### Output Format

In the `int Student::calculateTotalScore()` function, you must return the student's total grade (the sum of the values in `scores`).

The locked code in the editor will determine how many scores are larger than Kristen's and print that number to the console.

#### Sample Input

The first line contains `n`, the number of students in Kristen's class. The `n` subsequent lines contain each student's 5 exam grades for this semester.

```
3
30 40 45 10 10
40 40 40 10 10
50 20 30 10 10
```

#### Sample Output

```
1
```

#### Explanation

Kristen's grades are on the first line of grades. Only 1 student scored higher than her.

You have earned 20.00 points!

```

Complete the update function in the editor below.

update has the following parameters:

- int \*a: an integer
- int \*b: an integer

#### Returns

- The function is declared with a void return type, so there is no value to return.

Modify the values in memory so that  $a$  contains their sum and  $b$  contains their absolute difference.

- $a' = a + b$
- $b' = |a - b|$

#### Input Format

Input will contain two integers,  $a$  and  $b$ , separated by a newline.

#### Sample Input

```
4  
5
```

#### Sample Output

```
9  
1
```

#### Explanation

- $a' = 4 + 5 = 9$
- $b' = |4 - 5| = 1$

### Input Format

Input will consist of four lines.

The first line will contain an integer, representing the age. The second line will contain a string, consisting of lower-case Latin characters ('a'-'z'), representing the first\_name of a student.

The third line will contain another string, consisting of lower-case Latin characters ('a'-'z'), representing the last\_name of a student.

The fourth line will contain an integer, representing the standard of student.

Note: The number of characters in first\_name and last\_name will not exceed 50.

### Output Format

The code provided by HackerRank will use your class members to set and then get the elements of the Student class.

### Sample Input

```
15
john
carmack
10
```

### Sample Output

```
15
carmack, john
10
15, john, carmack, 10

This code prints the contents of string *s*, a single space (" "), then the integer *n*. We end our line of output with a newline using `endl`. This results in the following output:

High 5

### Task

Read 3 numbers from stdin and print their sum to stdout.

### Input Format

One line that contains 3 space-separated integers: *a*, *b*, and *c*.

### Constraints

- $1 \leq a, b, c \leq 1000$

### Output Format

Print the sum of the three numbers on a single line.

### Sample Input

1 2 7

### Sample Output

10

### Explanation

The sum of the three numbers is  $1 + 2 + 7 = 10$ .

the base class Triangle called Isosceles.

```
class Isosceles : public Triangle{public:    void isosceles(){        cout<<"I am an isosceles triangle\n";    }};
```

Now we can create a derived class object and use it to access the functions of the base class.

```
int main(){    Isosceles isc;    isc.isosceles();    isc.triangle();    return 0;}
```

This code will print:

I am an isosceles triangle  
I am a triangle

Now write a function in Isosceles class such that the output is as given below.

**Sample Output**

I am an isosceles triangle  
In an isosceles triangle two sides are equal  
I am a triangle
